

Results of the epidemiological wastewater surveillance of polioviruses in Slovenia

In 2024, Slovenia implemented epidemiological wastewater surveillance of polioviruses. Wastewater sampling is conducted quarterly at selected wastewater treatment plants, in accordance with the <u>Wastewater surveillance plan of polioviruses in Slovenia</u>.

The last confirmed case of poliomyelitis in Slovenia occured in 1978. Therefore, the primary objective of epidemiological wastewater surveillance of polioviruses in Slovenia is to detect any potential reintroduction of polioviruses into the country.

Monitoring results

Composite sample (for the area)	Results						
	4 th and 5 th	3 rd and 4 th	2 nd and 3 rd	2 nd and 3 rd	3 rd and 4 th	2 nd and 3 rd	1 st and 2 nd
	March 2024	June 2024	September 2024	December 2024	March 2025	June 2025	September 2025
Central Slovenian region – Ljubljana ¹	negative						
Central Slovenian region – other ²	negative						
Primorska region ³	negative	negative	negative	negative	negative	SL3* (WWTP Nova Gorica)	negative
Celje-Novo mesto region ⁴	negative						
Eastern Slovenia region ⁵	negative

Interpretation of results

The monitoring plan covers 16 major wastewater treatment plants, representing 34.2% of Slovenia's population across all statistical regions. Microbiological analysis of wastewater samples in September 2025 revealed no presence of polioviruses.

* In the wastewater sample from the WWTP Nova Gorica (from the composite sample for the Primorska region), the presence of a Sabin-like type 3 (SL3) was confirmed in June 2025.

Sabin polioviruses are used in oral polio vaccines (OPV). OPV is still widely used in national routine immunization programs in many countries outside of Europe, particularly in Asia and Africa. As a result, vaccine-derived Sabin and Sabin-like polioviruses can often be detected in the

population and in wastewater in areas where OPV is used for routine immunization, or in wastewater from areas where individuals recently vaccinated with OPV—who may be shedding the virus—are or have recently been present. The presence of SL3 in the wastewater at the Central Wastewater Treatment Plant Nova Gorica (CČN Nova Gorica) therefore did not pose a risk to public health, and no additional measures were necessary. However, it does demonstrate that Slovenia has a very sensitive and well-functioning system for epidemiological surveillance of polioviruses in wastewater.

Nevertheless, additional monitoring of polioviruses was carried out in wastewater samples from CČN Nova Gorica on June 17 and June 23, 2025. Polioviruses were not detected in these samples, suggesting that individuals vaccinated with OPV are no longer shedding the SL3 virus in the area of CČN Nova Gorica, or that such individuals are no longer present in this area.
